

Lecture 20: Cell-Cycle Regulation and the Genetics of Cancer

Read chapter 15.1-6
(642-675)

The normal cell division

G_1 : Cell grows in size, prepares for DNA replication

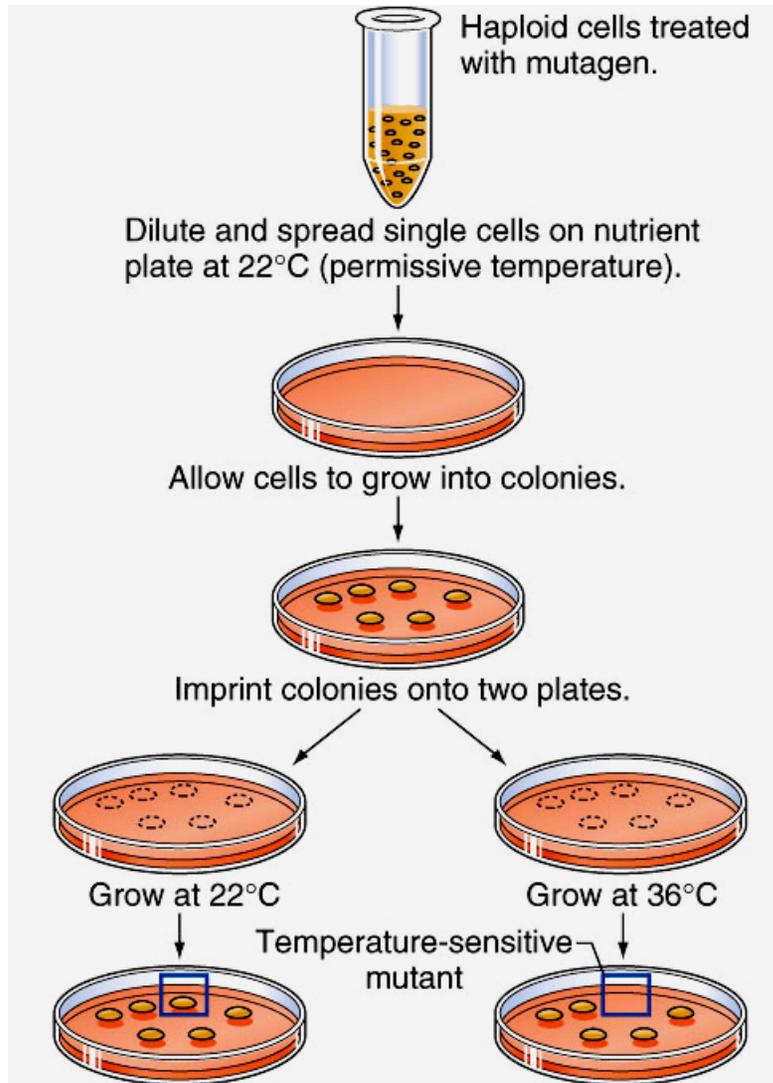

M: Mitosis

1. Breakdown of nuclear membrane
2. Condensation of chromosomes
3. Attachment of chromosomes to mitotic spindles

The cell cycle has four phases:

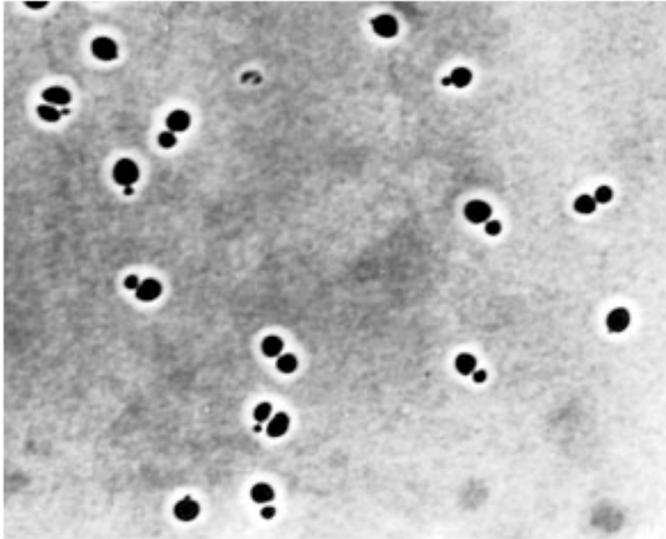

G_1 , S G_2 , and M

Isolation of temperature-sensitive mutants in yeast

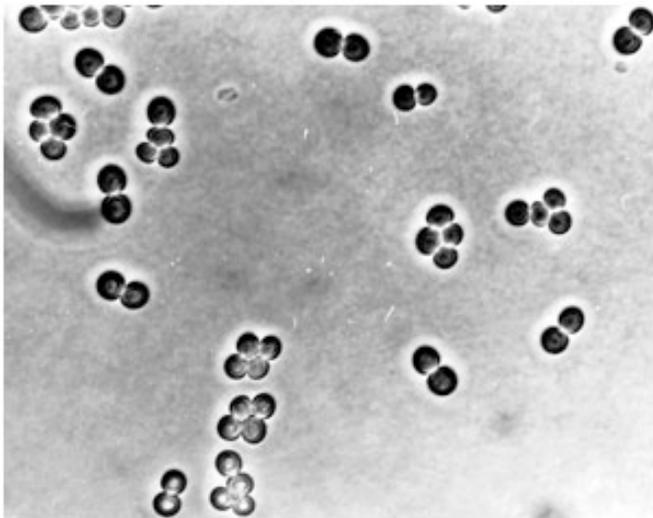

- Mutants grow normally at permissive temperature
- Mutants loses gene function at restrictive temperature
- Thousands of cell cycle mutants have been identified

A cell-cycle mutant in yeast

(a)

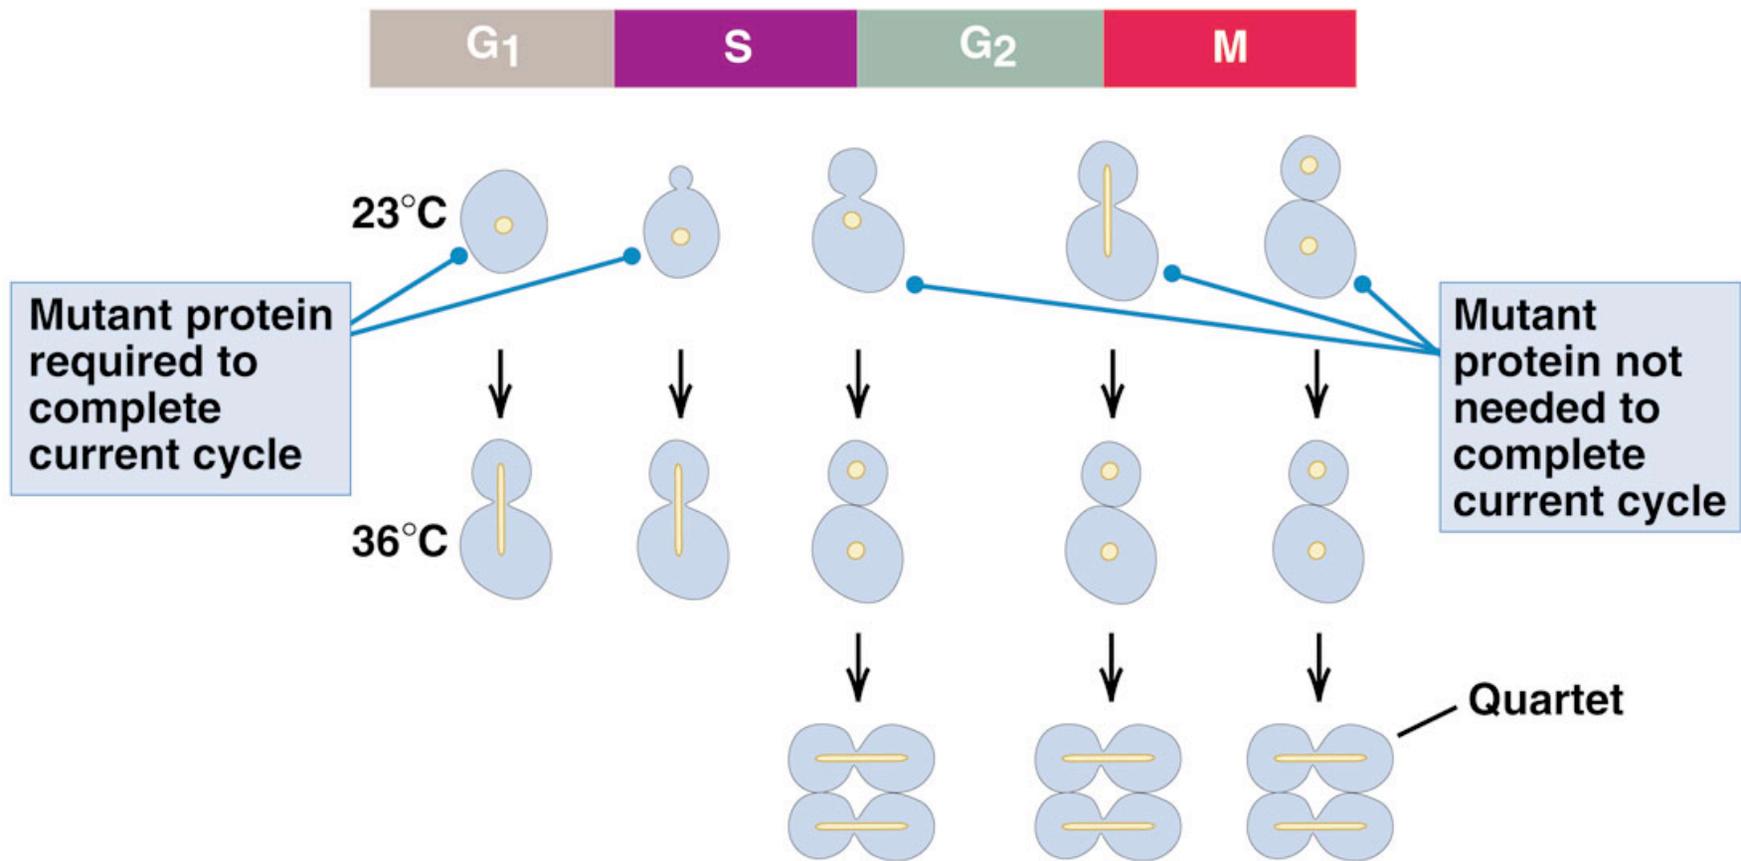

(b)

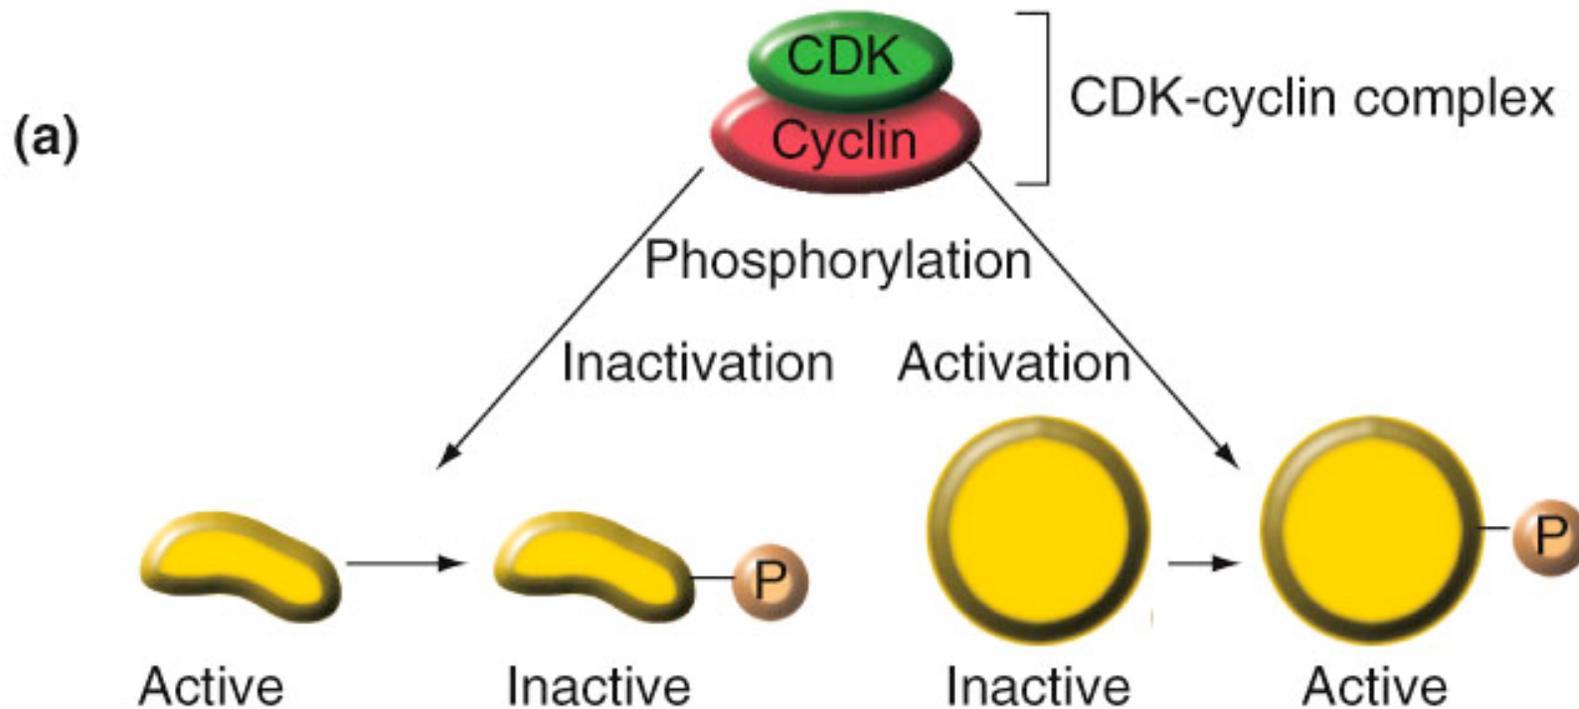

- (a) growth at permissive temperature displays buds of all sizes
- (b) growth at restrictive temperature shows cells have finished first cell cycle and arrested in the second

Fig. 15.6

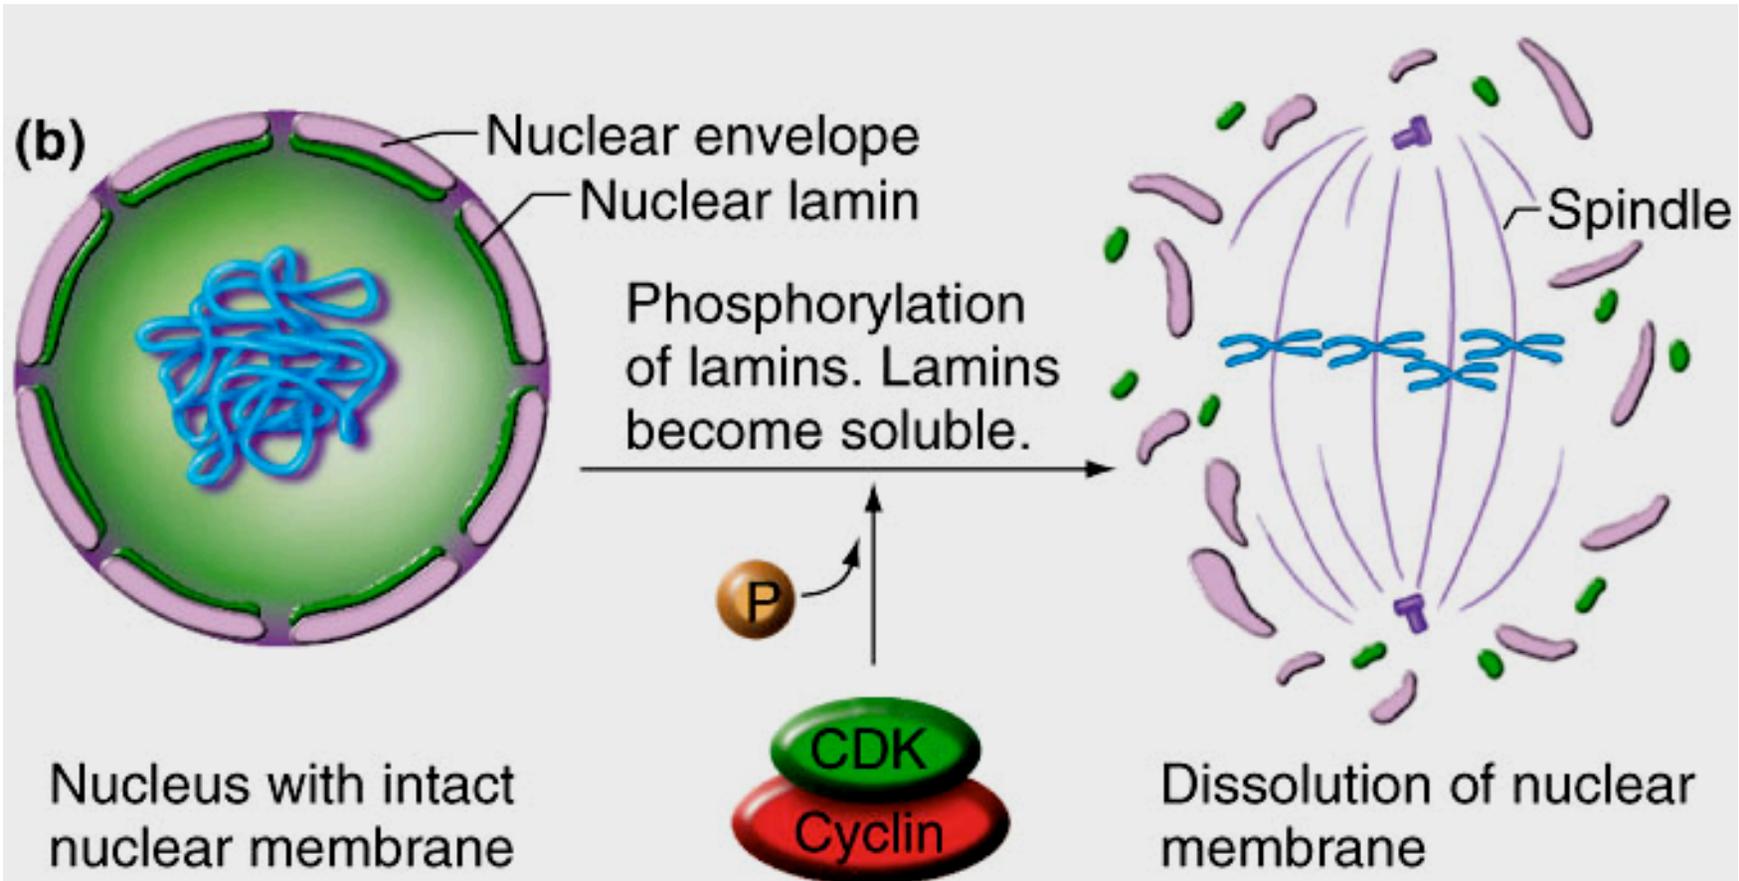

Use of heat-sensitive mutations to decipher the timing of a gene's function in the cell cycle

Cyclin-dependent kinases (CDK) control the cell cycle by phosphorylating other proteins

Nuclear lamins are one of the substrates of CDK

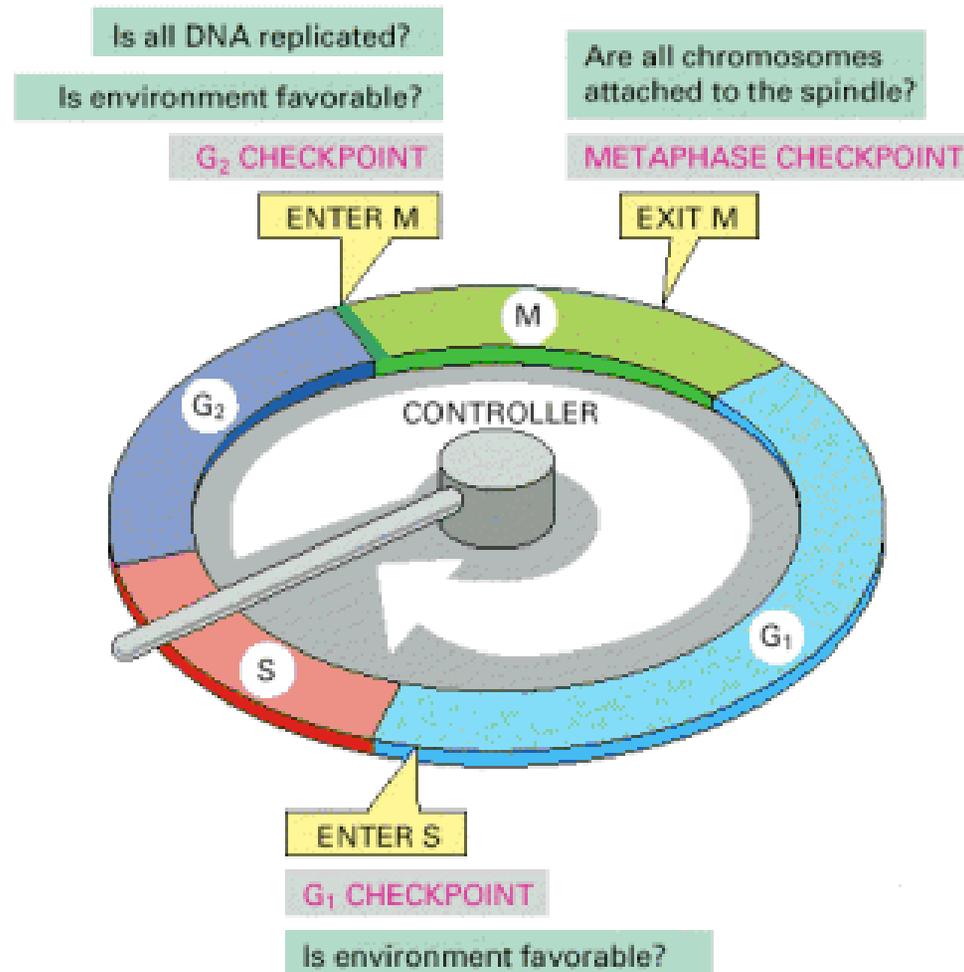

Three cell cycle check points ensure genomic stability

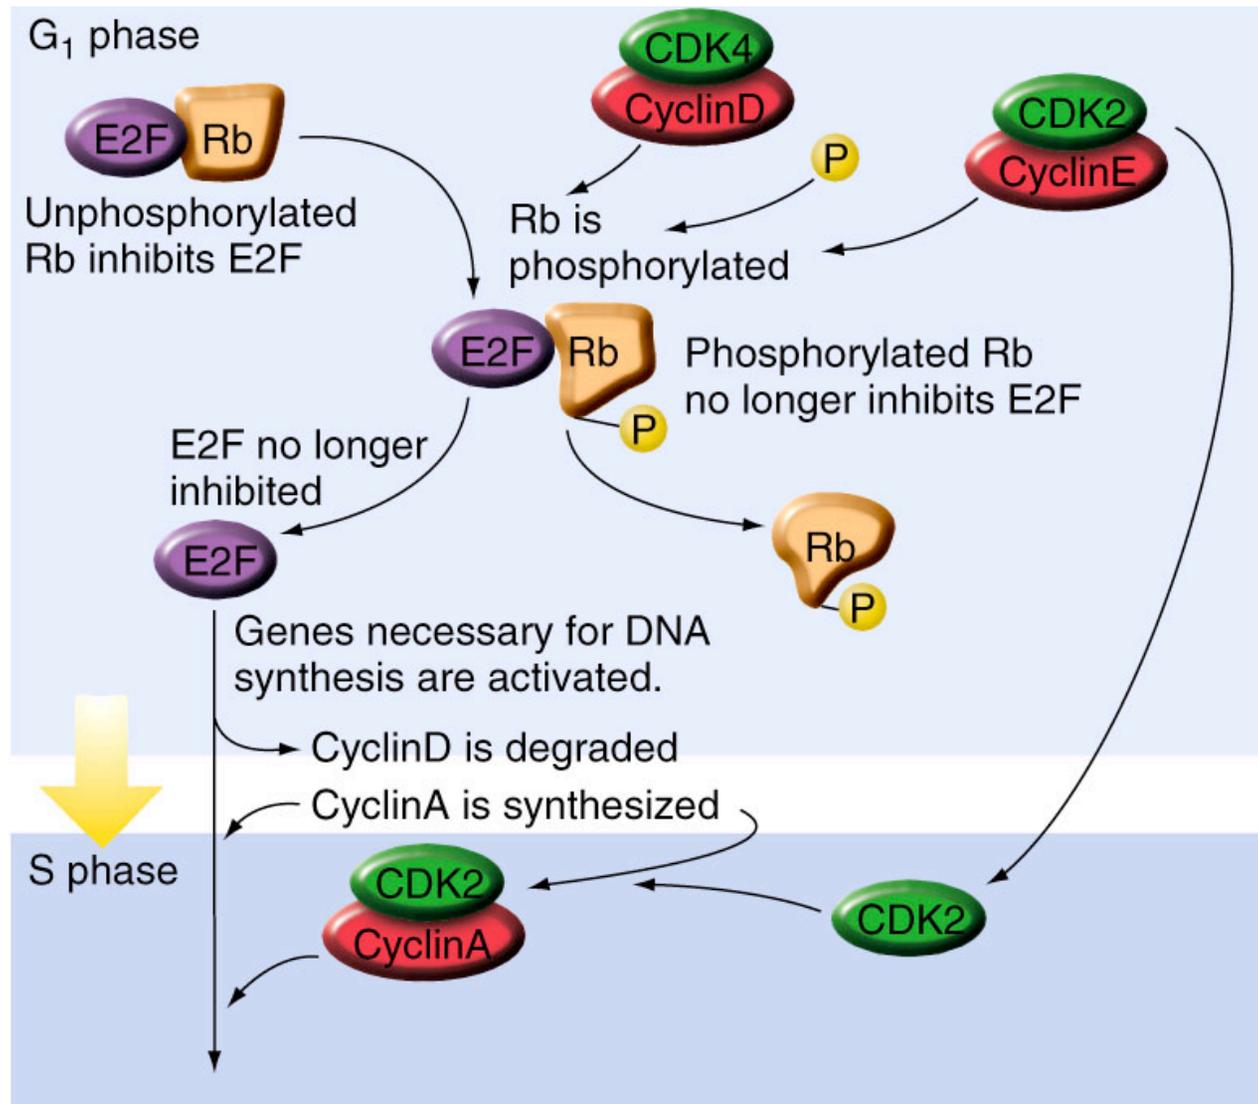

G₁ to S (start) check points

G₂ to M check points

Metaphase-anaphase check points

CDKs mediate the transition from the G_1 -to-S phase in human cells

Interactions between various tumor suppressors and proto-oncogenes in growth control of a cell

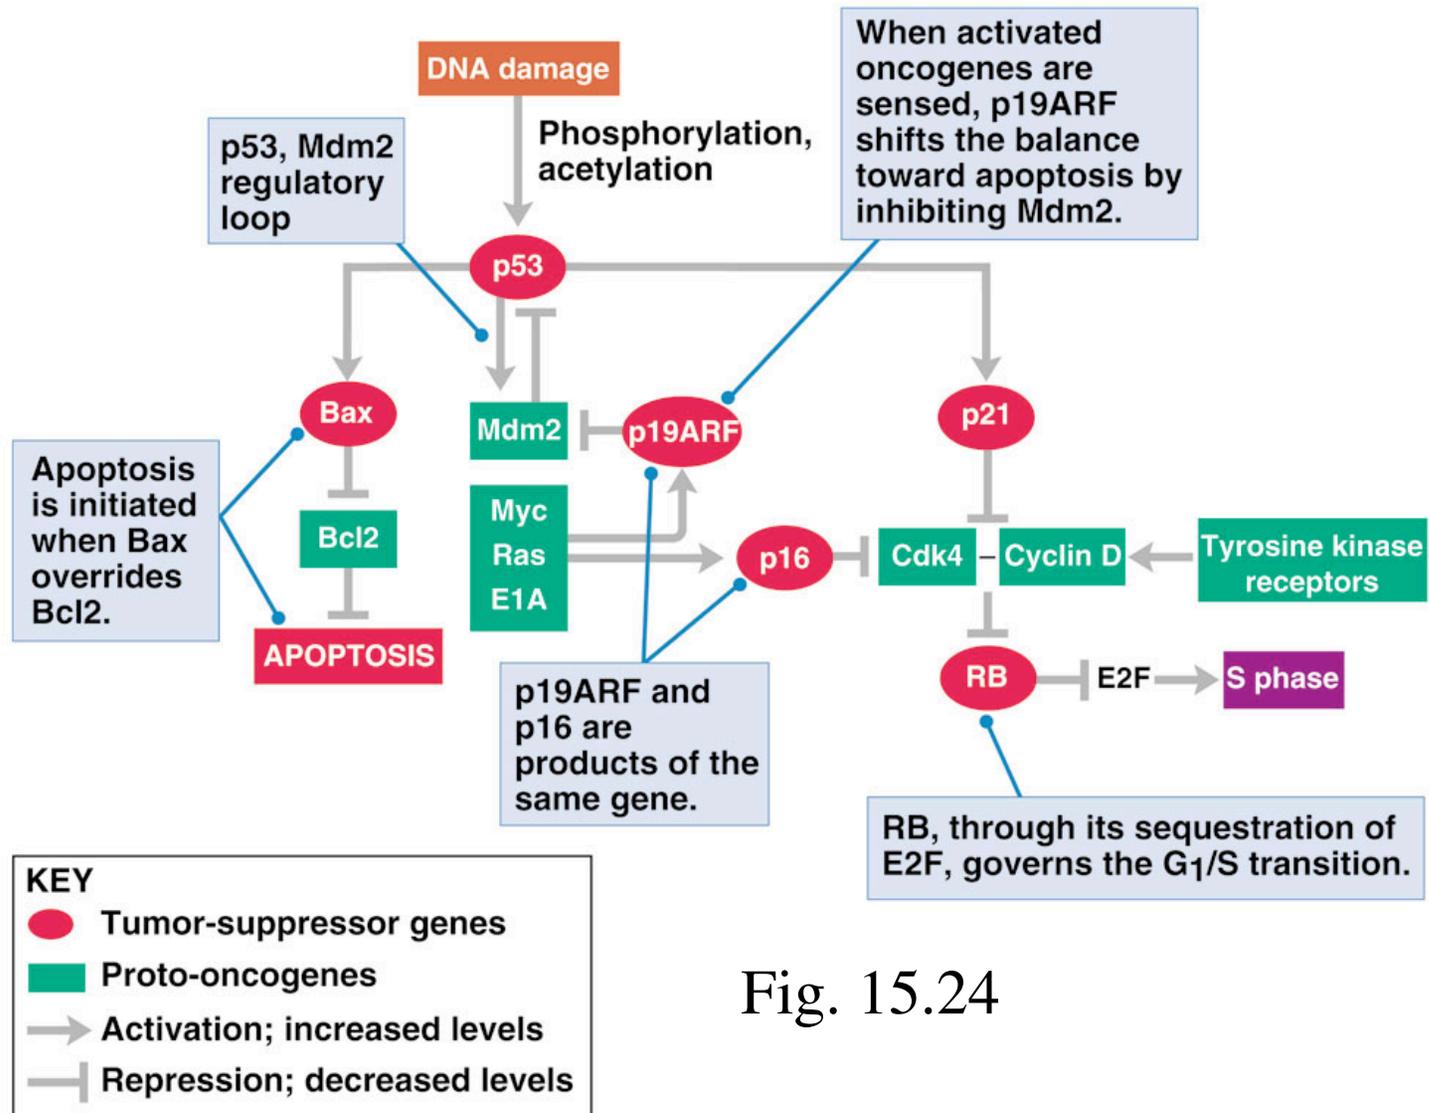

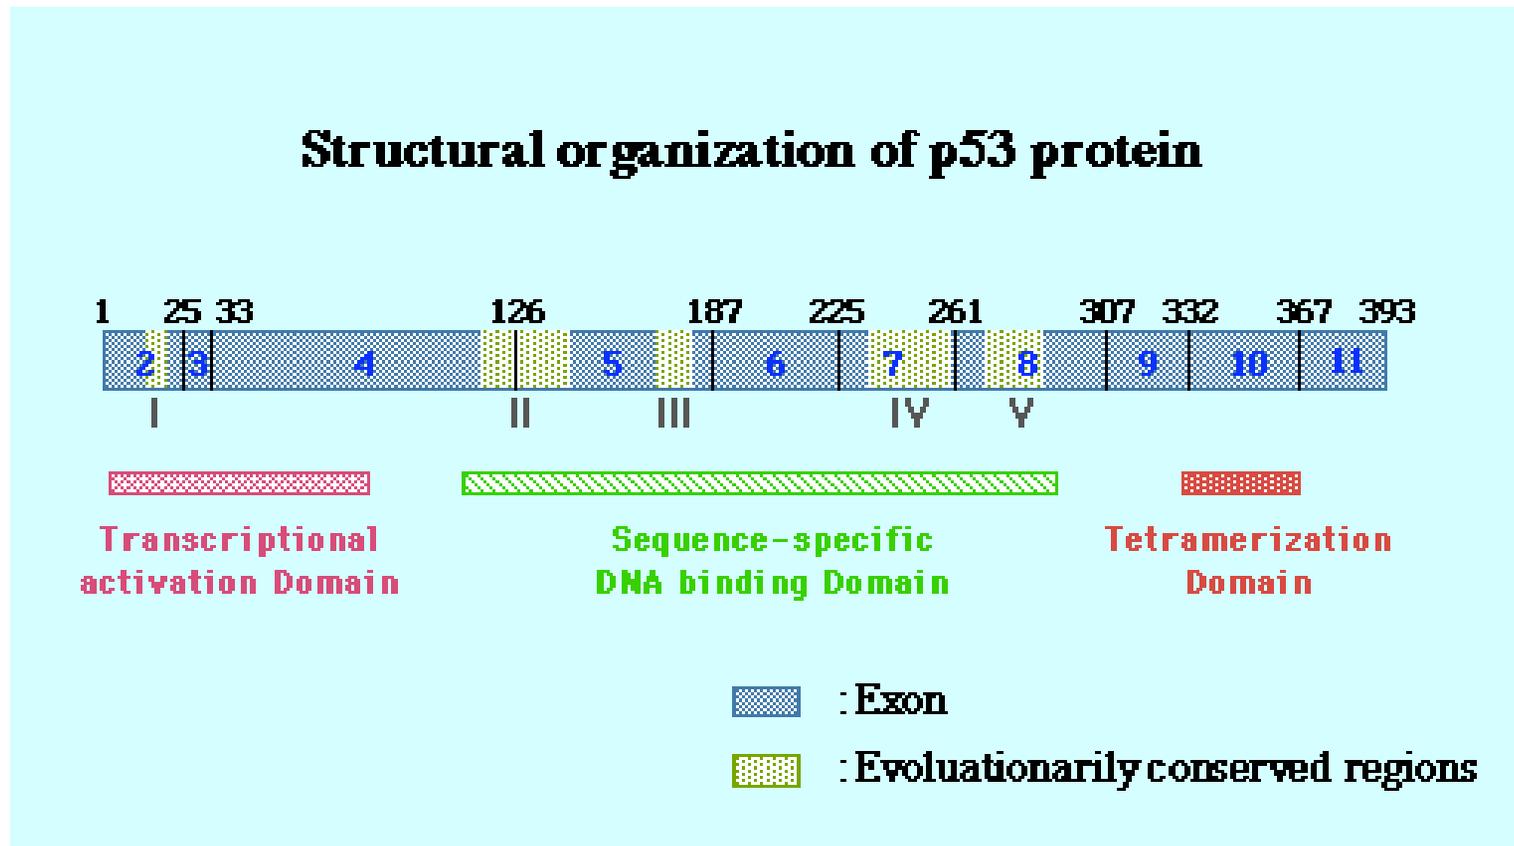

Fig. 15.24

70 cell-cycle genes identified through temperature-sensitive mutation screens

TABLE 18.1 Some of the Cell-Cycle Genes in Which Mutations Contribute to Cancer

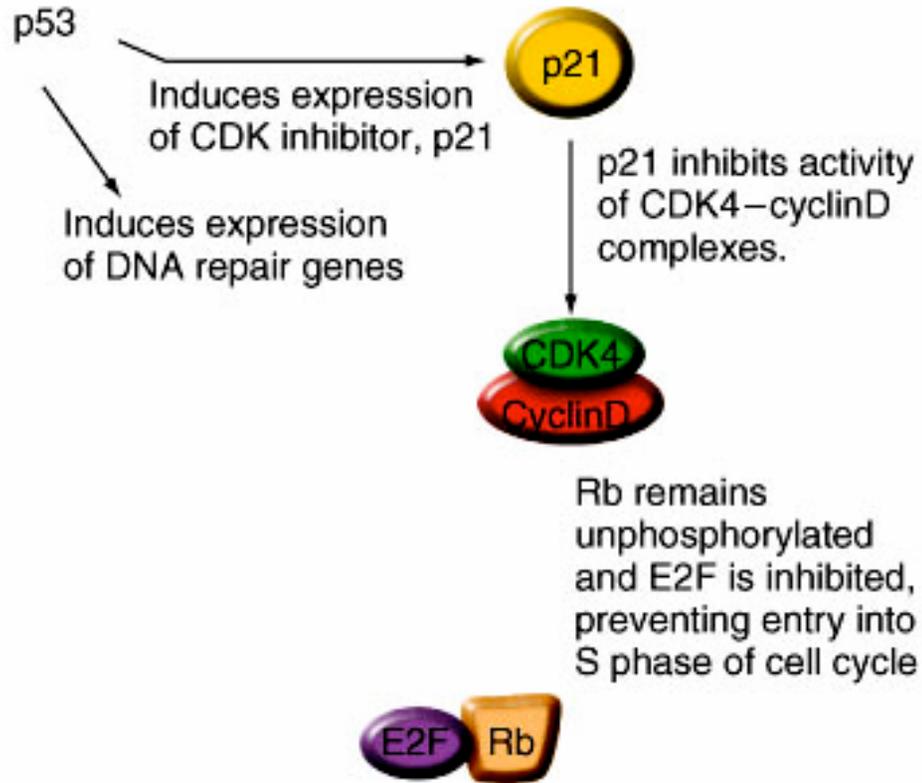

Genes	Gene Products and Their Function
<i>CDKs</i>	Enzymes known as cyclin-dependent protein kinases that control the activity of other proteins by phosphorylating them
<i>CDC28</i>	A CDK discovered in the yeast <i>Saccharomyces cerevisiae</i> that controls several steps in the <i>S. cerevisiae</i> cell cycle
<i>CDC2</i>	A CDK discovered in the yeast <i>Schizosaccharomyces pombe</i> that controls several steps in the <i>S. pombe</i> cell cycle; also the designation for a particular CDK in mammalian cells
<i>CDK4</i>	A CDK of mammalian cells important for the G ₁ -to-S transition
<i>CDK2</i>	A CDK of mammalian cells important for the G ₁ -to-S transition
<i>cyclins</i>	Proteins that are necessary for and influence the activity of CDKs
<i>cyclinD</i>	A cyclin of mammalian cells important for the G ₁ -to-S transition
<i>cyclinE</i>	A cyclin of mammalian cells important for the G ₁ -to-S transition
<i>cyclinA</i>	A cyclin of mammalian cells important for S phase
<i>cyclinB</i>	A cyclin of mammalian cells important for the G ₂ -to-M transition
<i>E2F</i>	A transcription factor of mammalian cells important for the G ₁ -to-S transition
<i>RB</i>	A mammalian protein that inhibits E2F
<i>p21</i>	A protein of mammalian cells that inhibits CDK activity
<i>p16</i>	A protein of mammalian cells that inhibits CDK activity
<i>p53</i>	A transcription factor of mammalian cells that activates transcription of DNA repair genes as well as transcription of <i>p21</i>
<i>RAD9</i>	A protein that inhibits the G ₂ -to-M transition of <i>S. cerevisiae</i> in response to DNA damage
<i>E6</i>	A protein of the HPV virus that inhibits p53
<i>E7</i>	A protein of the HPV virus that inhibits Rb

p53: an anti-oncogenic protein

- members of Li-Fraumeni cancer-prone families were shown to carry germ-line p53 mutations.
- mice that are homozygous null for p53 are highly predisposed to tumors.

(a) Transcription factor, p53 activated by UV or ionizing radiation

p53

(d) Apoptosis

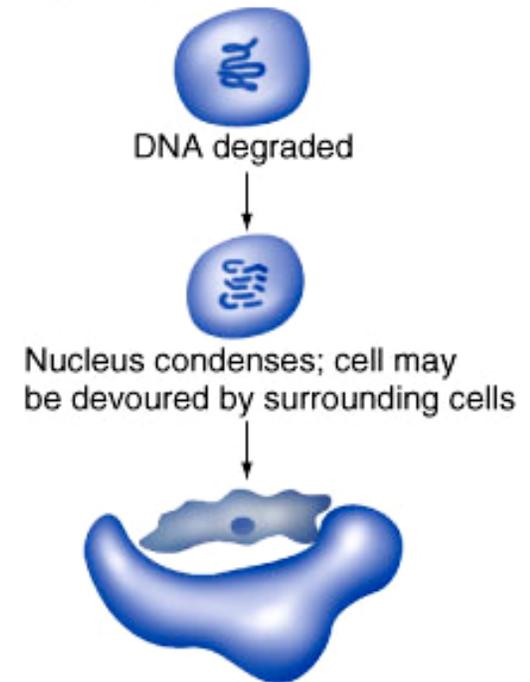

Fig. 18.11 a

Over 50% cancer cells contain mutations in p53

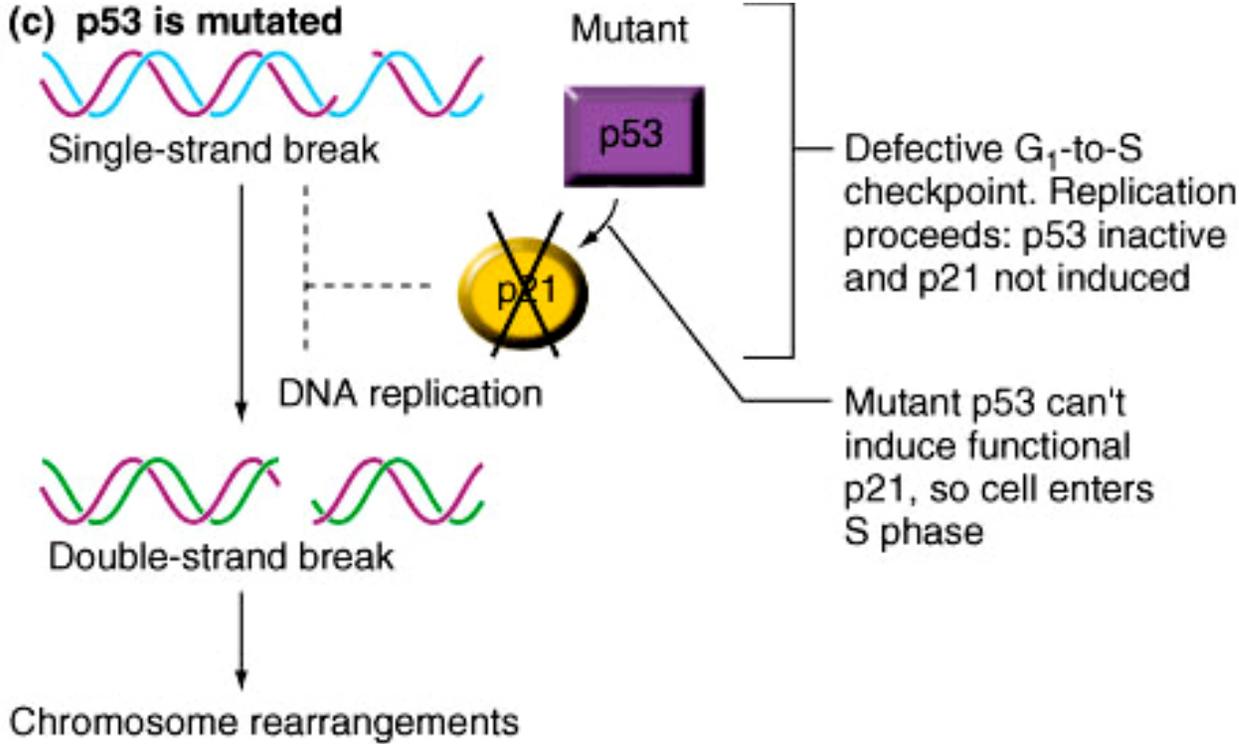

Fig. 18.11 c,d

G₂-to-M check points

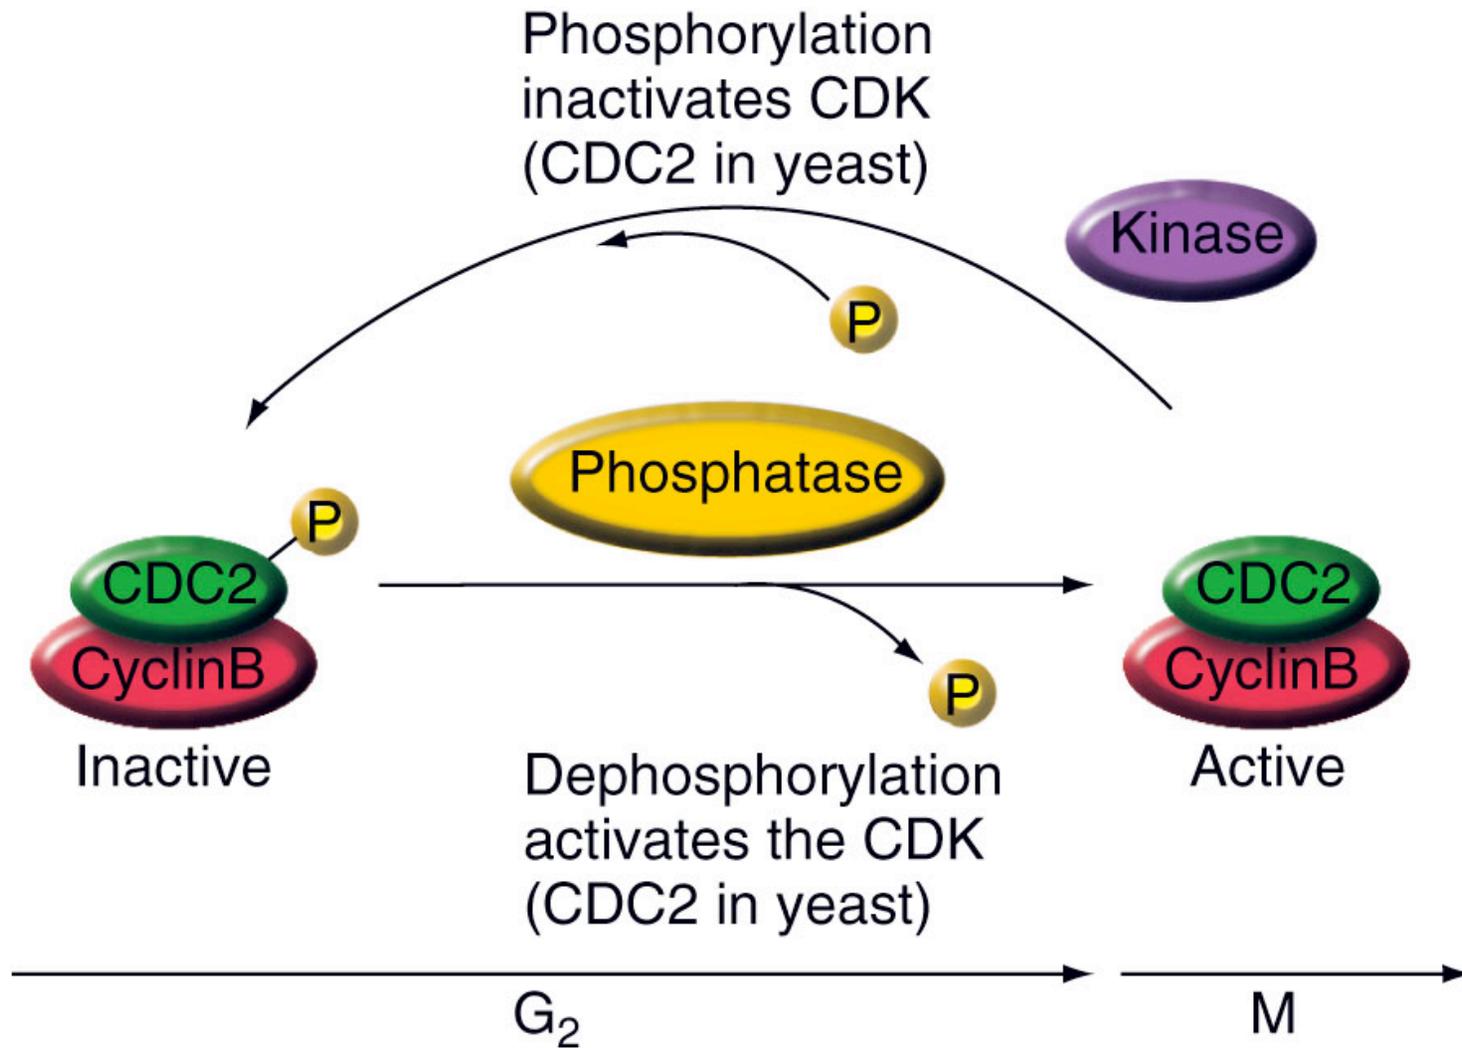

Fig. 18.10

G_2 -to-M check points

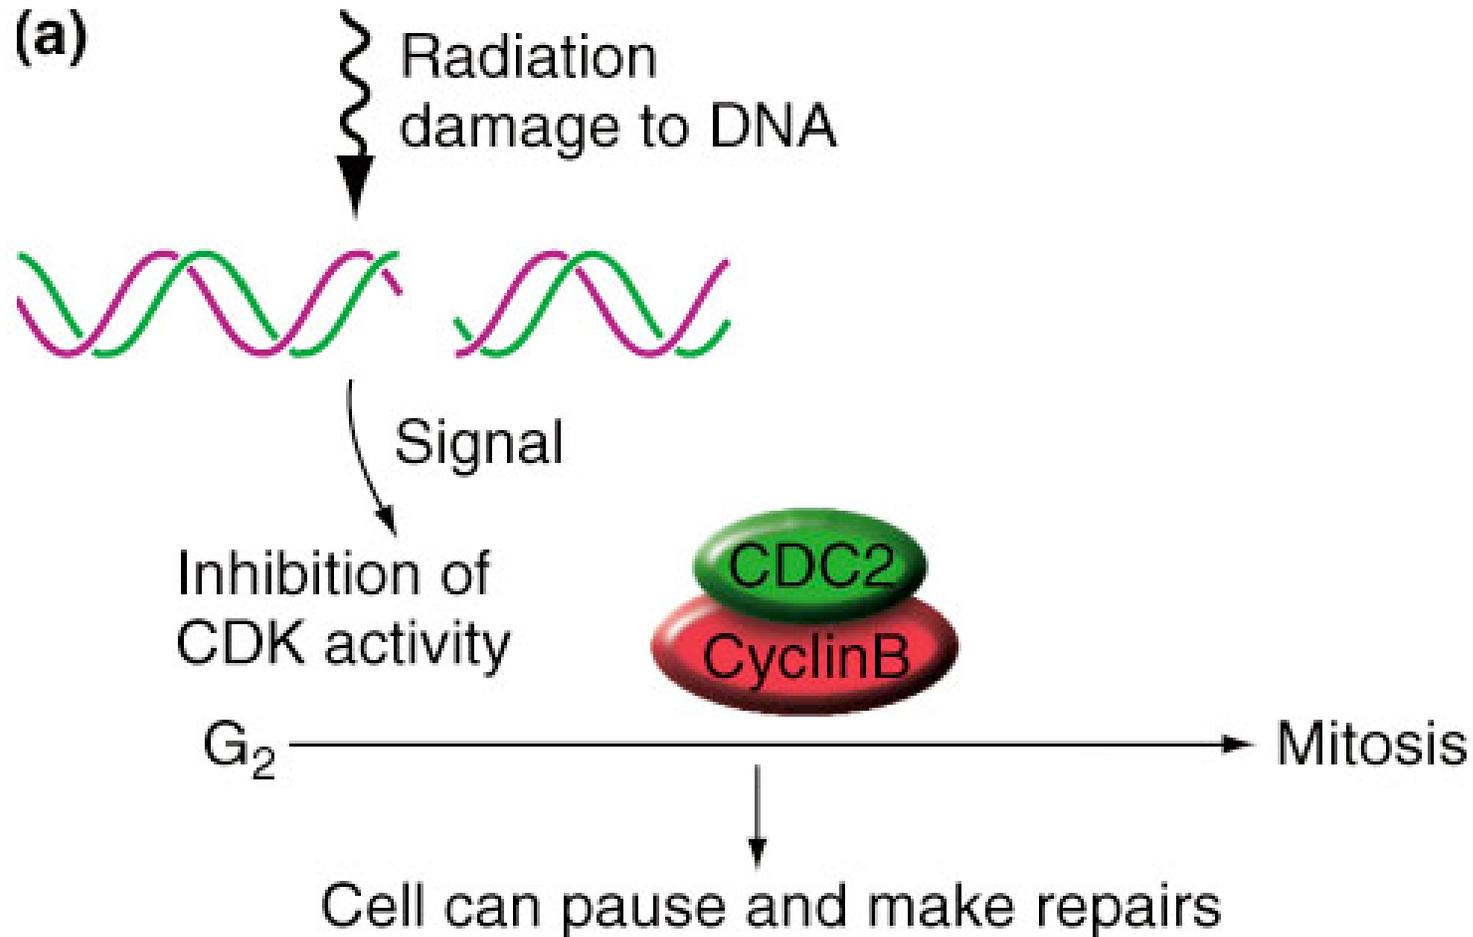

Fig. 18.12a

Metaphase to anaphase checkpoint

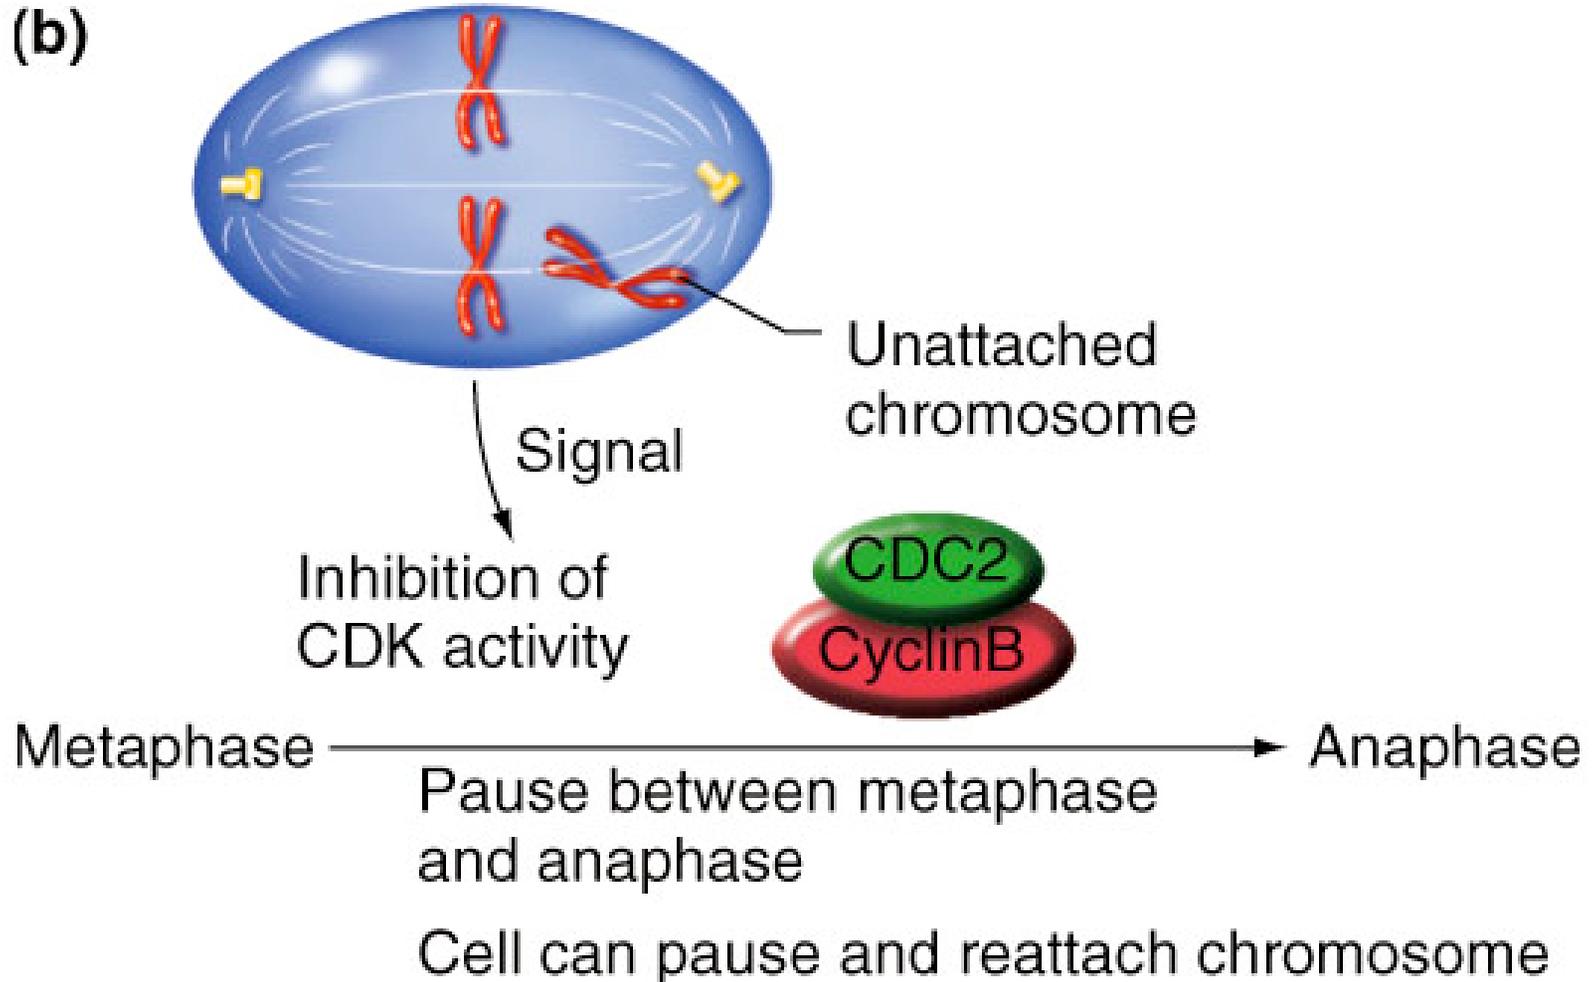

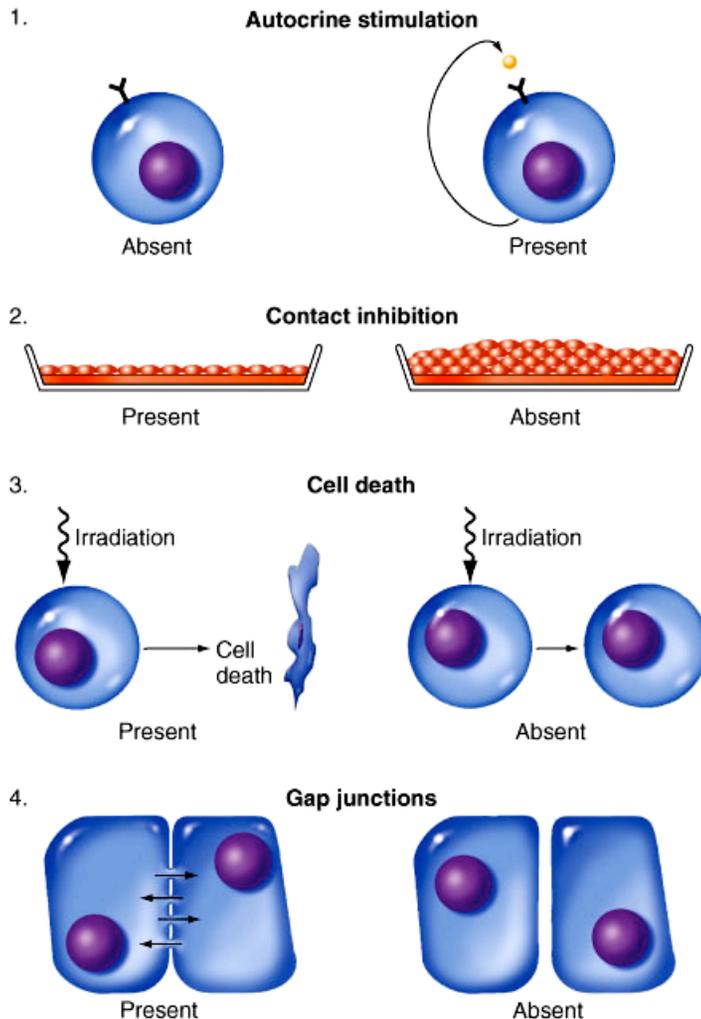

Fig. 18.12b

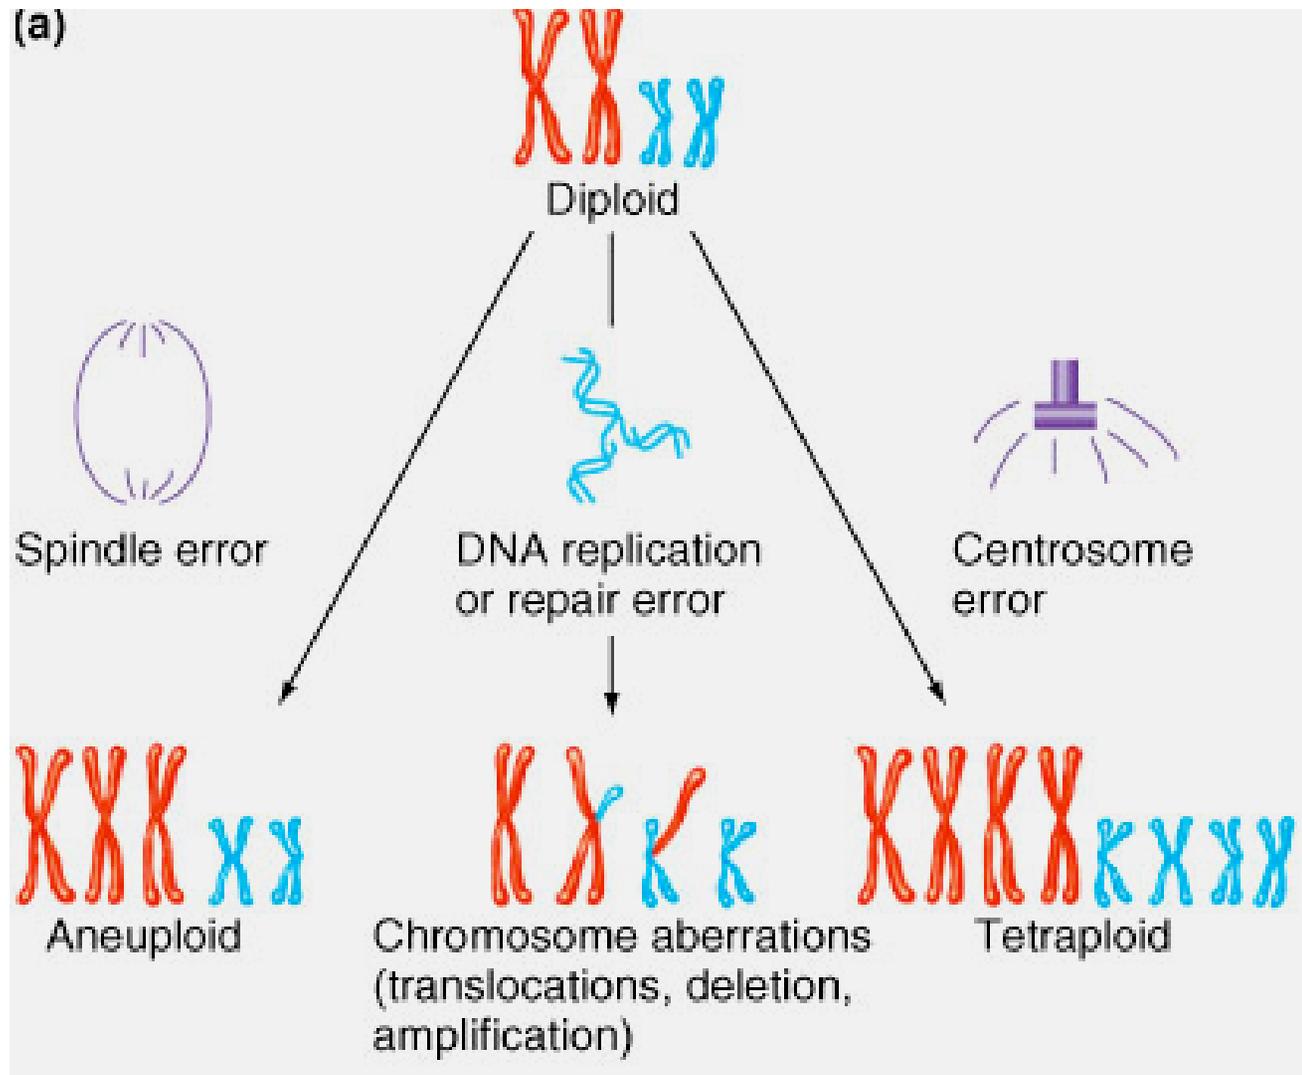

General cancer phenotype includes many types of cellular abnormalities

Copyright © The McGraw-Hill Companies, Inc. Permission required for reproduction or display.
(a) MOST NORMAL CELLS MANY CANCER CELLS

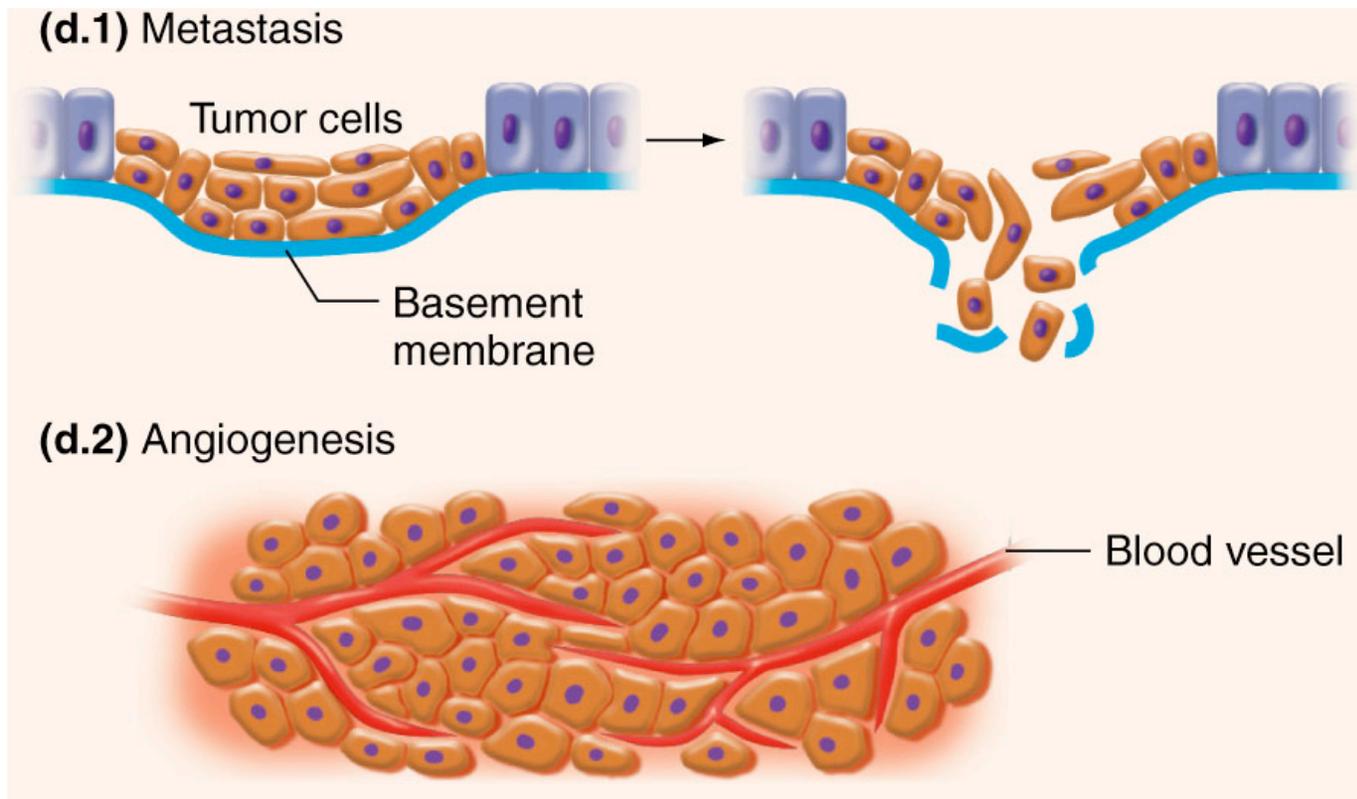

- Autocrine stimulation – tumor cells make their own signals to divide
- Loss of contact inhibition – lost property to stop dividing when contacted by another cell
- Loss of cell death – resistance to programmed cell death
- Loss of gap junctions – no channels for connecting to neighbor cell

Three classes of error lead to aneuploidy in tumor cells

Changes that enable tumor to disrupt local tissue and invade distant tissues

- Ability to metastasize
- Angiogenesis - secrete substances that cause blood vessels to grow toward tumor
- Evasion of immune surveillance

A. Cancer phenotype results from accumulation of multiple mutations in the clonal progeny of cells

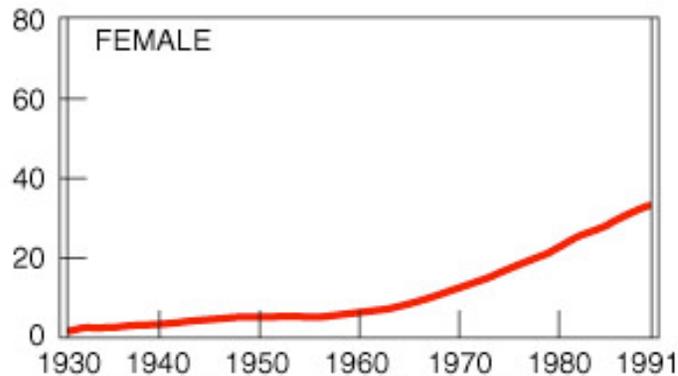

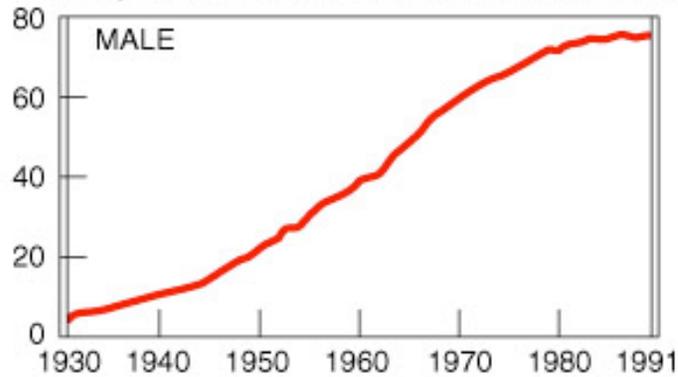

B. Most cancers result from exposures to mutagens

- If one sib or twin gets cancer, other usually does not
- Populations that migrate - profile of cancer becomes more like people indigenous to new location

Cancer develops over time

McGraw-Hill Companies, Inc. Permission required for reproduction.

(a) Lung cancer death rates, United States, 1930-91

Rates are per 100,000 and are age-adjusted to the 1970 U.S. census population.

(b)

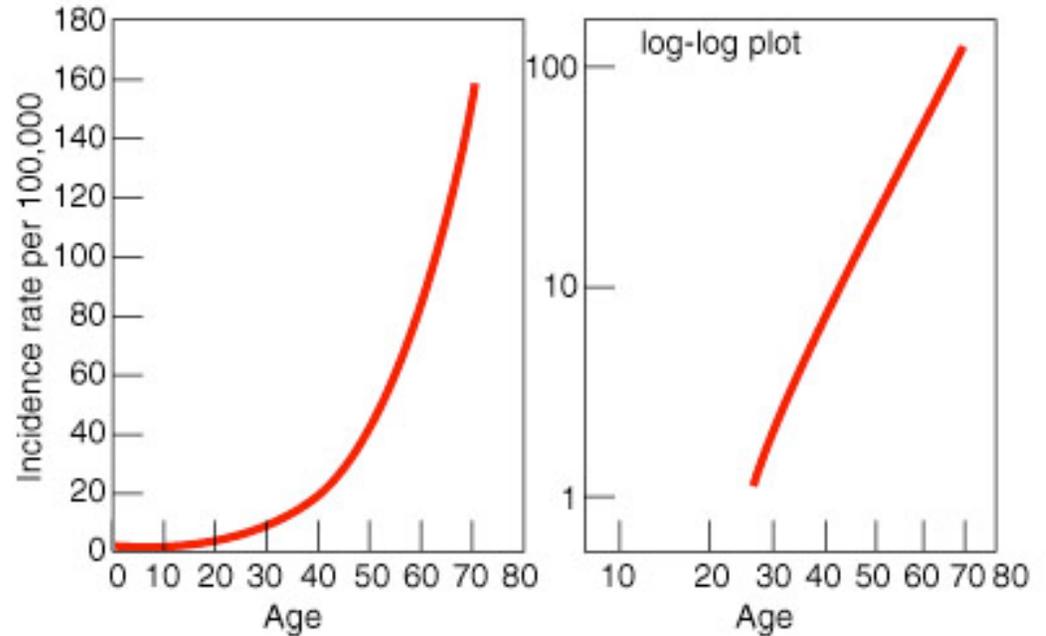

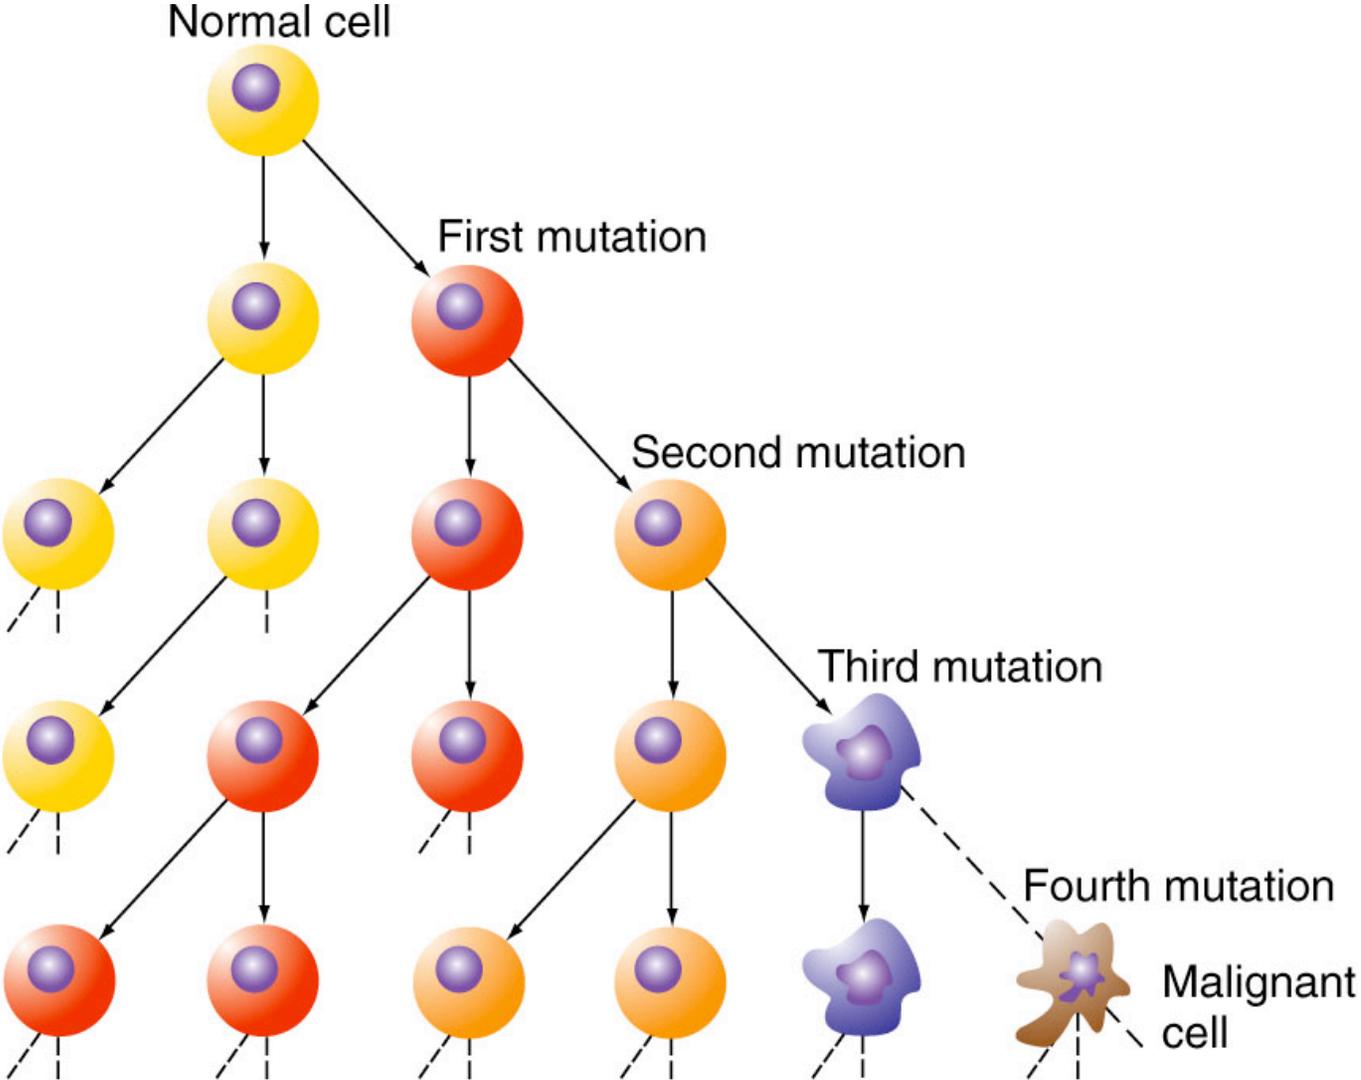

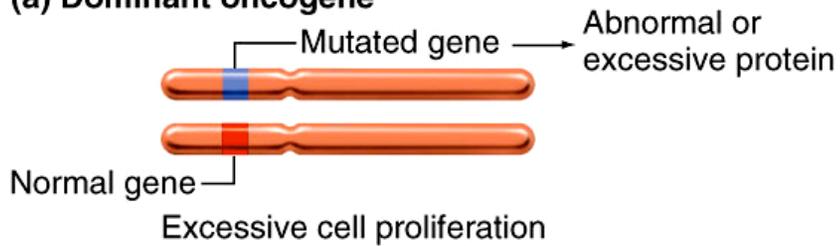

Fig. 18.19

Cancer arises by successive mutations in a clone of proliferating cells

Cancer mutations occur in two forms

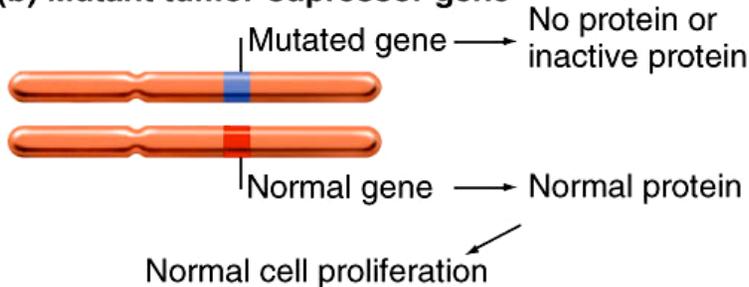

(a) Dominant oncogene

With one abnormal gene activated mutant protein is expressed.

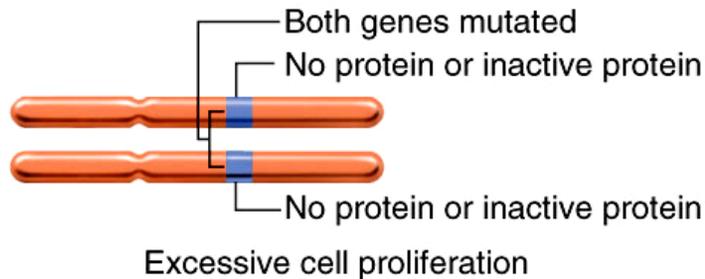

- Oncogenes
 - dominant mutations

(b) Mutant tumor-suppressor gene

With one mutated gene normal protein is still expressed.

- Mutant tumor-suppressor genes
 - recessive mutations

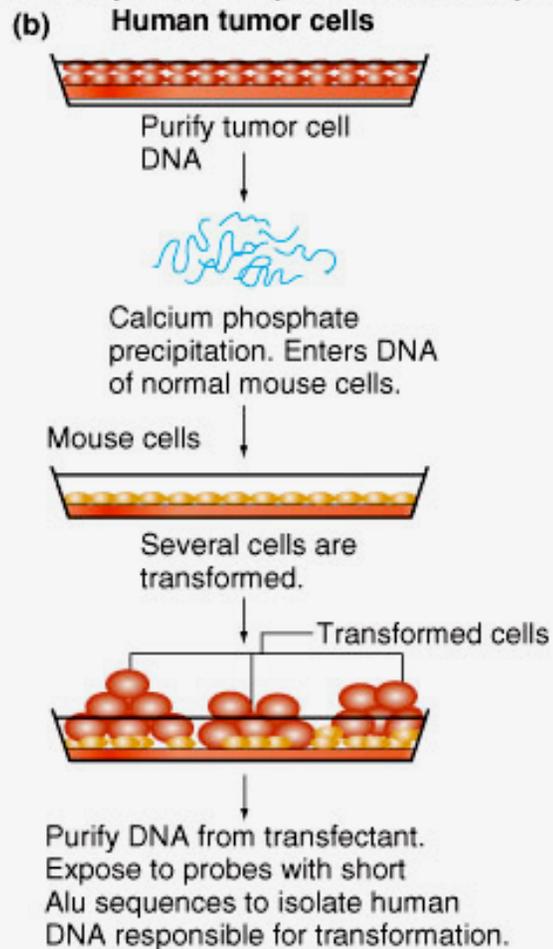

With two mutated genes no normal protein is expressed.

Oncogenes

TABLE 18.3 Retroviruses and Their Associated Oncogenes*

Virus	Species	Tumor	Oncogene
Rous sarcoma	Chicken	Sarcoma	<i>src</i>
Harvey murine sarcoma	Rat	Sarcoma and erthyroleukemia	<i>H-ras</i>
Kristen murine sarcoma	Rat	Sarcoma and erthyroleukemia	<i>K-ras</i>
Moloney murine sarcoma	Mouse	Sarcoma	<i>mos</i>
FBJ murine osteosarcoma	Mouse	Chondrosarcoma	<i>fos</i>
Simian sarcoma	Monkey	Sarcoma	<i>sis</i>
Feline sarcoma	Cat	Sarcoma	<i>sis</i>
Avian sarcoma	Chicken	Fibrosarcoma	<i>jun</i>
Avian myelocytomatosis	Chicken	Carcinoma, sarcoma, and myleocytoma	<i>myc</i>
Ableson leukemia	Mouse	B cell lymphoma	<i>abl</i>

Permission required for reproduction or display.

- Exposure of noncancerous cells to tumor DNA in culture
 - Human tumor DNA to transform normal mouse cells
 - Human DNA isolated from transformants

Tumor suppressor genes

TABLE 18.5 Mutant Alleles of These Tumor-Suppressor Genes Decrease the Accuracy of Cell Reproduction*

Gene	Normal Function of Gene (if known), or Disease Syndrome Resulting from Mutation	Function of Normal Protein Product
<i>p53</i>	Controls G ₁ -to-S checkpoint	Transcription factor
<i>RB</i>	Controls G ₁ -to-S transition	Inhibits a transcription factor
<i>p21</i>	Controls G ₁ -to-S transition	Inhibits CDK
<i>ATM</i>	Controls G ₁ -to-S phase, and G ₂ -to-M checkpoint	DNA-dependent protein kinase
<i>BS</i>	Recombinational repair of DNA damage	DNA/RNA ligase
<i>XP</i>	Excision of DNA damage	Several enzymes
<i>hMSH2, hmLH1</i>	Correction of base-pair matches	Several enzymes
<i>FA</i>	Fanconi anemia	Unknown
<i>BRCA1</i>	Repair of DNA breaks	Unknown
<i>BRCA2</i>	Repair of DNA breaks	Unknown

Some cancers run in families such as retinoblastoma
