California Roadkill Observation System • Copyright Notice

Observations

- Who, What, Where, When, How
- Other data attributes
- Controlled Vocabularies
 - Species list, habitat types, QA vocabularies, Gazetteers

Goals

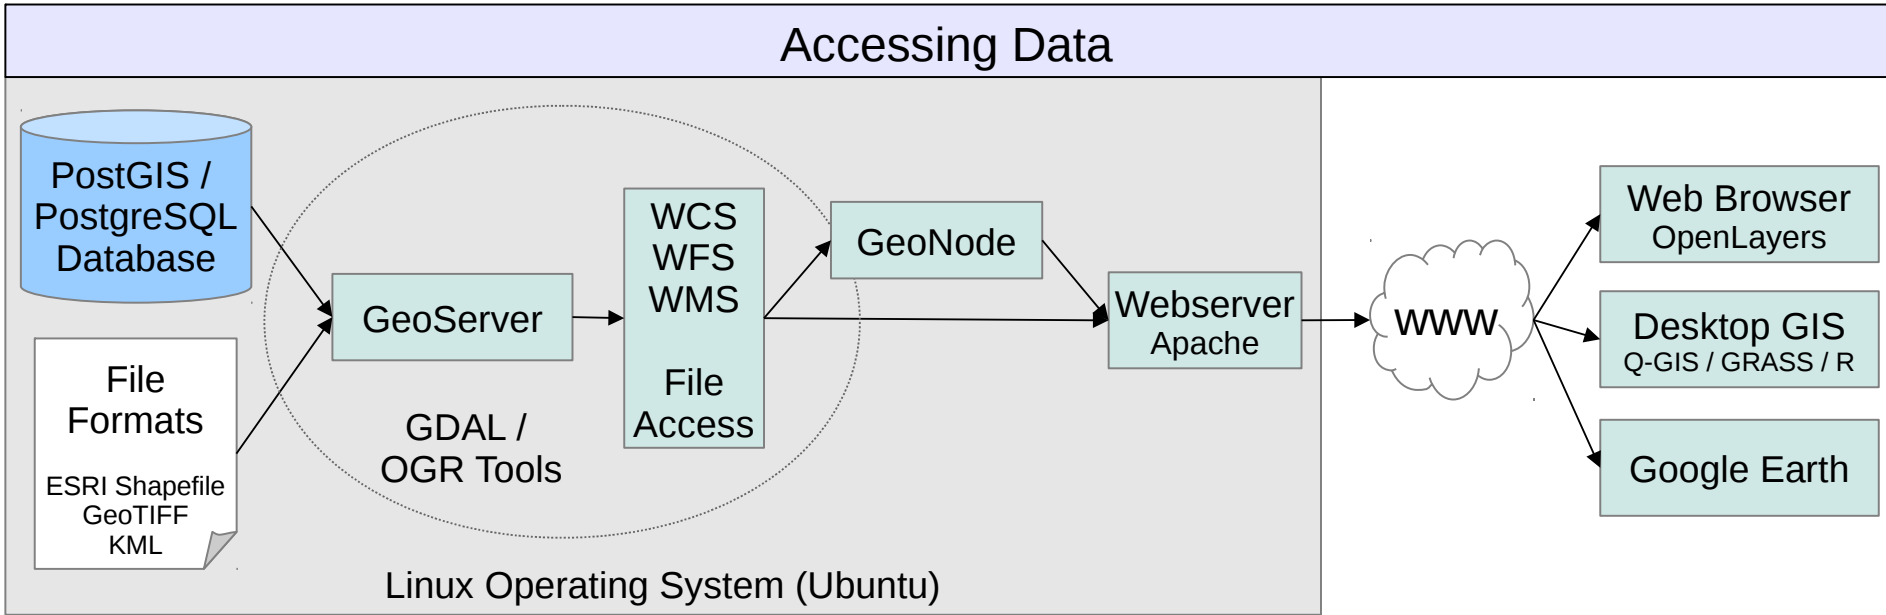

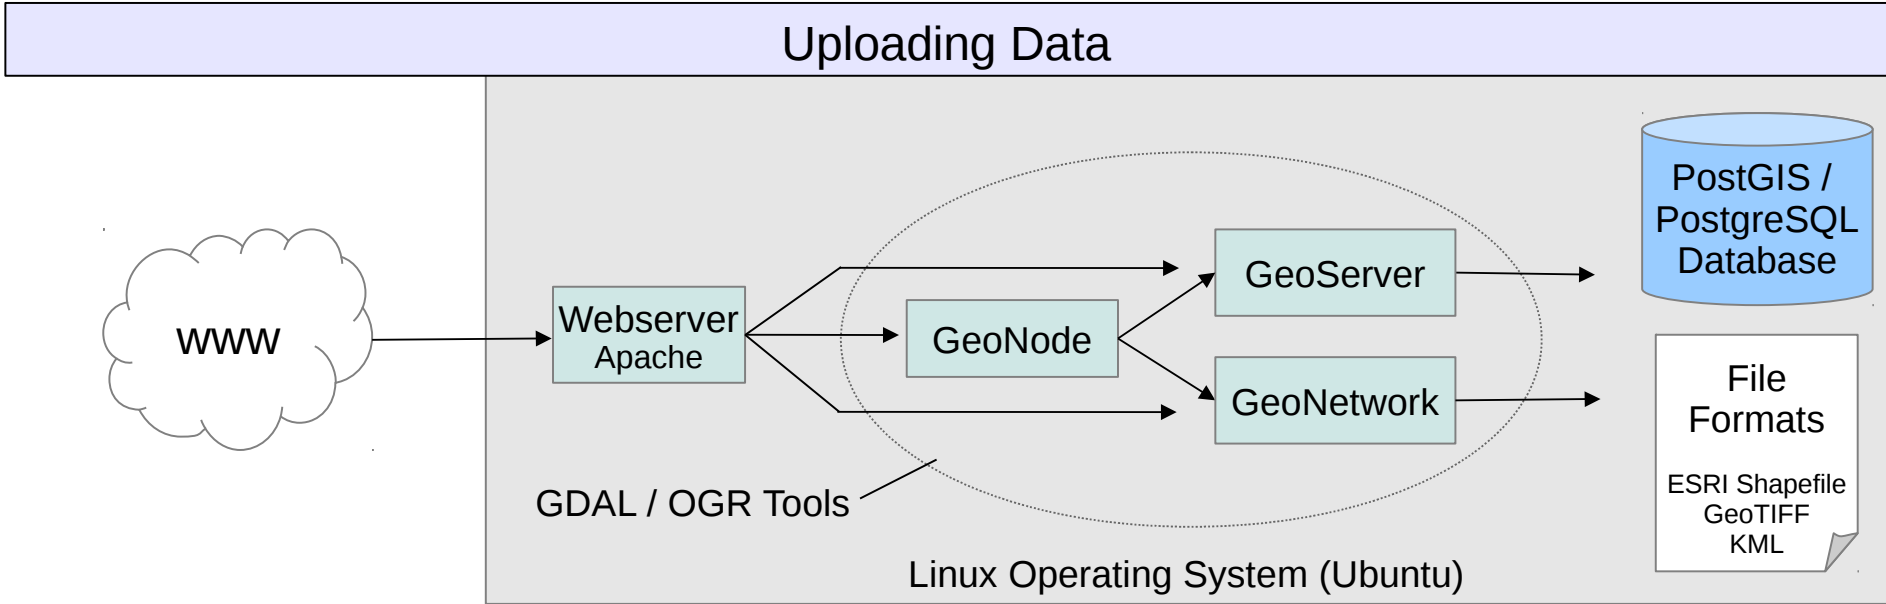

- Build a standards-based framework for collecting, storing, and sharing data
- Incorporate distributed data sources
- Work at creating a common set of concepts which have well defined semantics (already exist?)
- Be flexible, so that any additional (meta)data can be easily added
- Allow humans and non-human consumers
- Use open source tools so that others can easily duplicate / replicate the system architecture
- Support open science by sharing data

Geospatial Technology Stack

- **GeoNode** – Web application for managing geospatial data, including visualizations and data discovery
- **GeoServer** – Provides Open Geospatial Consortium (OGC) standards for data access including WMS, WFS, WCS
- **GeoNetwork** – Metadata catalog
- **GeoWebCache / TileCache** – Methods to increase performance
- **GDAL / OGR** – Library for, reading, writing, and transforming geospatial data (raster and vector)
- **PostGIS / PostgreSQL** – Spatial and relational database

Data Formats

- Geospatial Data
 - WMS – Web Mapping Service
 - WFS – Web Feature Service
 - WCS – Web Coverage Service
- Tabular Data
 - CSV – Comma Separated Values
- Exchange Formats
 - Darwin Core – exchange animal / museum specimen data
 - Dublin Core – digital resource metadata standard

Vocabularies

- Controlled vocabularies are a set of predefined terms which have a set domain.
 - Assign categorical variables or the data attribute.
 - examples: habitat types, QA / QC terms, statewide species list
- Natural language vocabularies allow for additions to the vocabulary by users
 - examples: tag clouds
- Vocabularies and their terms can be encoded as an *ontology*, where links can be made to authoritative sources and “meaning” can be assigned to the terms.

Semantic Web Linkage

- The purpose of the semantic web is to establish (unambiguous) “meaning” to digital objects by encoding data and metadata in a specialized way.
 - This includes building a network of assertions that contain a subject, object, and predicate and these three “entities” are mapped to URL's which can help define their authoritative meaning.
- These databases are called triple stores, and there are a set of tools (SPARQL) to query these data.

Representing Observations

Subject	Predicate	Object
Painted Lady (<i>Vanessa cardui</i>)	observed at	Rancho Cordova
Painted Lady (<i>Vanessa cardui</i>)	observed on	April 25, 2009
Painted Lady (<i>Vanessa cardui</i>)	observed by	Arthur M. Shapiro

- Encode observations in RDF (Turtle format)

```
@prefix taxa:  
  <http://ecoinfo.ice.ucdavis.edu/taxa/> .  
@prefix ex: <http://www.example.com/observe/> .
```

```
taxa:Vanessa_cardui  
  ex:observedAt "Rancho Cordova";  
  ex:observedOn "2009-04-25:T14:30-07:00";  
  ex:observedBy "Arthur M. Shapiro".
```

Welcome to the Maine Audubon Wildlife Road Watch

April 4, 2012 - 3:55pm -- [BarbaraCharrv](#)

Information about where wildlife attempt to cross roads, what animals are involved, on what kinds of roads are collisions frequent, and other data can help inform policy, management, and financial investment in reducing road-kill and habitat fragmentation. Maine Audubon scientists will use the data to improve our collective understanding of where wildlife attempt to cross roads and what we can do to reduce road-kill and increase safety for people and wildlife.

Start contributing your own observations:

1. [Create an account](#) to help us identify observations from specific observers.
2. [Add observations](#) by specifying what you saw, pinpointing its location on the map, and even uploading your photos (if you took any).
3. Then review your observation markers, and see where other citizen scientists are finding road-side wildlife, by browsing [our online wildlife observations map](#).

Maine Audubon, state agencies, and researchers will use the data you share on this site in order to better understand how roads affect wildlife. Thanks for participating!

Citizen Science for Wildlife-Friendly Roads

March 15, 2012 - 1:44pm -- [BarbaraCharrv](#)

The Maine Audubon Wildlife Road Watch is a web-based map and database designed to record your observations of road-side and road-killed wildlife.

NEW: Endangered Species Roadwatch seeking volunteers in southern Maine.

Want to do something that is both good for you and good for Maine's wildlife?

Maine Audubon is recruiting volunteers to take part in a special survey for endangered species along roads in southern Maine. Walk a one-mile survey stretch in spring and summer, look for wildlife, and help endangered species.

Drupal 7 with a Responsive HTML5 base theme. This allows one to build their website for small screen sizes (smartphones and tablets).

Drupal 7 version

- Improved modules / core improvements
- Features module – bundle an instance of Drupal as a “generic” system which can be tailored and customized, yet maintain many core observation elements and vocabularies.
- OpenLayers module – pull in WMF / WFS maps. Support for “Behaviors”
- Omega Theme – micro first... opens door for all handheld devices to utilize the website interface to enter observations

VOCABULARY NAME
+ Animal Age Class
+ Animal Category
+ Animal Group
+ Animal Spoor Type
+ Cause of Death
+ Confidence
+ County
+ Development Type
+ Estimated Time Since Death
+ Gender
+ Habitat Type
+ IUCN Conservation Status
+ Observation Type
+ Organization
+ Organization Type
+ Review Status
+ Road Barrier Type
+ Road Speed
+ Road Type
+ Roadside Features
+ Taxonomy
+ Travel Frequency
+ Travel Mode
+ Verification Status

From Data Management to Knowledge Procurement

- Gathering – (knowledge discovery) collection, mining
- Organizing – (knowledge classification) indexing, classifying, cataloging
- Refining – (knowledge improvement) collaboration, contextualization
- Representing – (knowledge representation) semantic networks, schemas
- Disseminating – (knowledge communication) communication, publishing, decision support
